# High Reliability Isolated Dual-Channel Gate Driver

Datasheet (EN) 1.0

## Product Overview

NSI66x2x is a family of high reliability isolated dual-channel gate driver ICs which can be configured as two low-side drivers, two high-side drivers, or a half-bridge driver. Each output could source 6A and sink 8A peak current with fast 33ns propagation delay and 6ns maximum delay matching. It is designed to drive power MOSFET, SiC, GaN, and IGBT transistors.

The NSI66x2x provides 3000Vrms isolation in SOP16 or SOP14 package, and 5700Vrms isolation in SOW16 or SOW14 package. System robustness is supported by 150kV/us typical common-mode transient immunity (CMTI).

The driver operates with a maximum supply voltage of 25V, while the input-side accepts from 3V to 18V supply voltage. Under voltage lock-out (UVLO) protection is supported by all the power supply voltage pins.

## Key Features

- Isolated dual channel driver
- Input side supply voltage: 3V to 18V
- Driver side supply voltage: up to 25V with UVLO
- 6A peak source and 8A peak sink output
- High CMTI:  $\pm 150\text{kV}/\text{us}$  typical
- 33ns typical propagation delay
- 6ns maximum delay matching
- 8ns maximum pulse width distortion
- Programmable deadtime
- Accepts minimum input pulse width 20ns
- Operation temperature: -40°C~125°C
- RoHS & REACH Compliance
- AEC-Q100 (Grade 1) qualified for auto-motive Application

## Safety Regulatory Approvals

- UL recognition:
  - SOW16/SOW14: 5700V<sub>rms</sub> for 1 minute per UL1577
  - SOP16/SOP14: 3000V<sub>rms</sub> for 1 minute per UL1577
- DIN EN IEC 60747-17 (VDE 0884-17)
- CSA component notice 5A
- CQC certification per GB4943.

## Applications

- Isolated DC-DC and AC-to-DC power supplies in server, telecom, and industry
- DC-to-AC solar inverters
- Motor drives and EV battery chargers
- Uninterruptible power supply (UPS)

SYMBOL		FUNCTION
GNDI	Input-side ground reference.	
INA	TTL compatible input signal for channel A with internal pull down to GNDI. It is recommended to connect this pin to GNDI if not used.	
INB	TTL compatible input signal for channel B with internal pull down to GNDI. It is recommended to connect this pin to GNDI if not used.	
VDDI	Input-side supply voltage. It is recommended to place a bypass capacitor from this pin to GNDI as close as possible.	
DIS	Disables the isolator inputs and driver outputs if asserted high, enables if asserted low or left open. It is recommended to connect this pin to GNDI if not used.	
EN	Enable the isolator inputs and driver outputs if asserted high, disable if asserted low or left open. It is recommended to connect this pin to VDDI if not used.	
DT	Programmable deadtime control. To allow the outputs overlapping by connecting DT to VDDI. Place a 1kΩ to 200kΩ resistor (RDT) between DT and GND to adjust deadtime	

	following: $t_{DT} \text{ (ns)} = 10 \times R_{DT} \text{ (k}\Omega\text{)}$ . It is recommended to parallel a low ESR capacitor, e.g., 2.2nF or above.
GNDB	Ground for output channel B
OUTB	Output gate driver for channel B
VDDB	Supply voltage for channel B
GNDA	Ground for output channel A
OUTA	Output gate driver for channel A
VDDA	Supply voltage for channel A
NC	Not connected

## 8. Function Description

### 8.1. Overview

NSI66x2x is a high reliability dual channel isolated gate driver which could be designed in variety switching power and motor drive topologies. NSI66x2x has some useful protections, such as under voltage lock out (UVLO) for both input and output supply, enable function, deadtime control, default low output as input is floating. The functional circuit block diagram is shown as below:

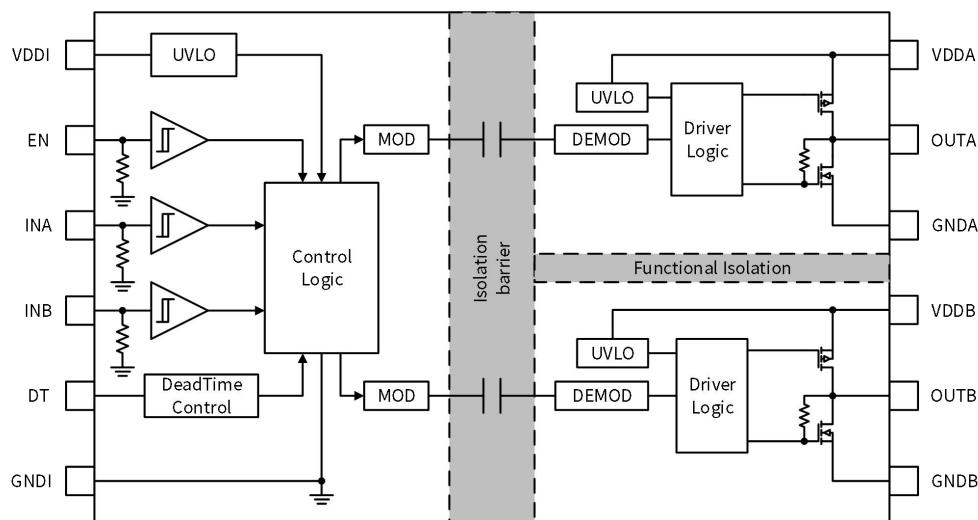

Figure 8.1 Functional Block Diagram (NSI6602N)

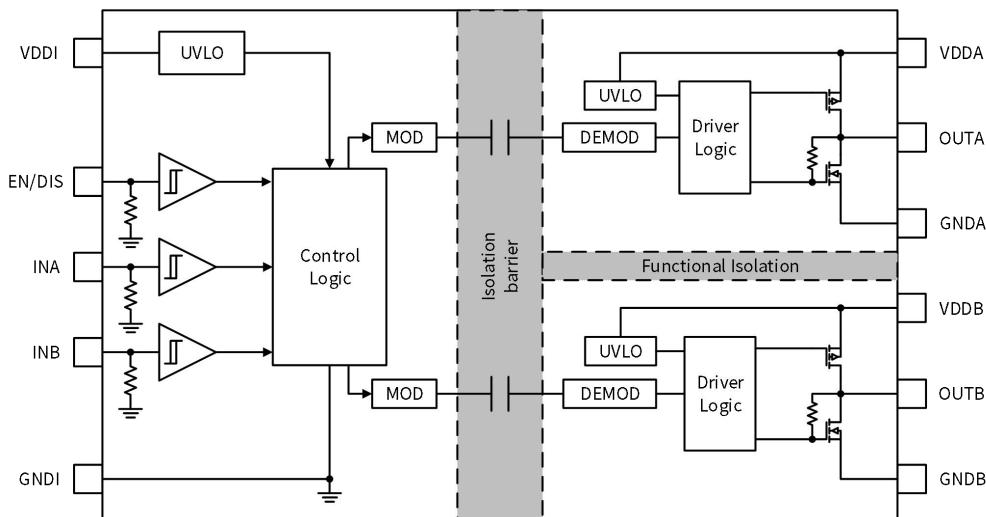

Figure 8.2 Functional Block Diagram (NSI6622x)

### 8.2. Undervoltage Lockout (UVLO)

The NSI66x2x has an internal under voltage lock out (UVLO) protection on both input and output supply circuit blocks. The driver output is held low by an active clamp circuit when the supply voltage of VDDI or VDDA/VDB is lower than  $V_{VDD\_ON}$  at power-up status or lower than  $V_{VDD\_OFF}$  after power-up, regardless of the status of the input pins.

The VDDI and VDDA/B UVLO protections have hysteresis ( $V_{VDD\_HYS}$ ) to prevent chatter noise from VDD supply and allow small drops in supply power which are usually happened in startup.

## Input and Output Logic Table

The table below consists of truth tables for the NSI66x2x families.

### 8.3. Programmable Deadtime (DT pin)

#### 8.3.1. Pulling the DT Pin to VDDI

This allows outputs match inputs completely and no deadtime is asserted.

#### 8.3.2. DT Pin Left Open or Connected to a Programming Resistor between DT and GNDI Pins

If the DT pin is left open, the deadtime duration ( $t_{DT}$ ) is set to <35ns.  $t_{DT}$  can be programmed by placing a resistor,  $R_{DT}$ , between the DT pin and GNDI. The appropriate  $R_{DT}$  value can be determined from Equation 1, where  $R_{DT}$  is in kΩ and  $t_{DT}$  in ns:

$$t_{DT} \approx 10 \times R_{DT} \quad (1)$$

The recommended value of  $R_{DT}$  is between from 1kΩ to 200kΩ. The steady state voltage at DT pin is about 0.8V and the DT pin current will be less than 10uA when  $R_{DT} = 100\text{k}\Omega$ . It is also recommended to parallel a ceramic capacitor, for example 2.2nF, with  $R_{DT}$  to achieve better noise immunity.

The programmed deadtime is activated by the input signal's falling edge to prevent shoot-through when the device is designed in an application of high side and low side driver. The details of input and output logic with deadtime are shown as Figure 8.4:

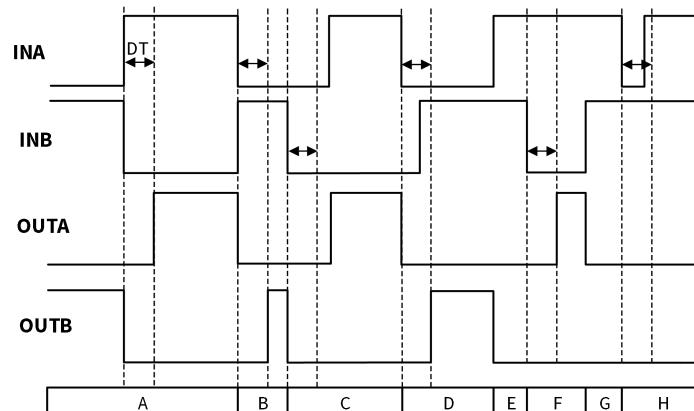

Figure 8.3 Input and Output Logic with the Programmed Deadtime (NSI6602N)

Condition	Result
A: INA goes high, and INB goes low.	OUTB goes low immediately, then OUTA goes high after the programmed deadtime which is assigned at INB goes low.
B: INA goes low, and INB goes high.	OUTA goes low immediately, then OUTB goes high after the programmed deadtime which is assigned at INA goes low.
C: INB goes low, then INA goes high after	OUTB goes low immediately, then OUTA goes high immediately

deadtime.	when INA goes high.
D: INA goes low, then INB goes high before deadtime.	OUTA goes low immediately, then OUTB goes high after deadtime
E: INA goes high, INB is still high.	OUTB goes low immediately and OUTA keeps low.
F: INA is still high, INB goes low.	OUTA goes high after deadtime while INB is low and OUTB keeps low.
G: INA is still high, INB goes high after deadtime	OUTA goes low immediately and OUTB keeps low.
H: INA goes low then goes high before deadtime while INB is still high.	OUTA keeps low and OUTB keeps low because deadtime control.

## 9. Application Note

### 9.1. Typical Application Circuit

The circuit shows a typical half-bridge configuration by using the driver NSI66x2x which could be used in several popular power converter topologies such as half-bridge/ full bridge / LLC isolated topologies, buck-boost topologies and 3-phase motor drive applications.

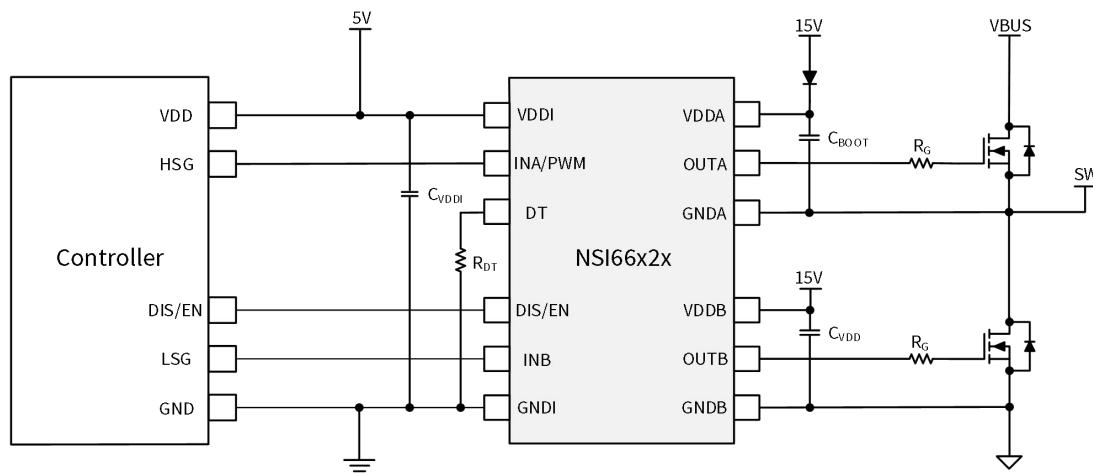

Figure 9.1 Typical Half-Bridge Application Schematic

## 9.2. PCB Layout

PCB layout is important to get optimal performance. Some key guidelines are given as below:

- Low-ESR and low-ESL bypass capacitors should be placed close to the device between pin VDDI to GNDI and pin VDDA/B to GNDA/B.
- There is high frequency switching current that charges and discharges the gate of external power transistor, leading to EMI and ring issues. The parasitic inductance of this loop should be minimized, by decreasing loop area and placing NSI66x2x close to power transistor.
- Large amount of copper should be placed at VDDA/B pin and GNDA/B pin for thermal dissipation.
- To ensure isolation performance between primary and secondary side, the space under the device should keep free from any plane, trace, pad or via.
